

Solutions

- 1) What kind of error is measurement error:
 - a. Error of observation
- 2) Provide two kinds of error of observation
Questions, mode of data collection, response error
- 3) Provide two kinds of error of non-observation: coverage-error, sampling error
- 4) What is the difference between target frame and sample frame? The target frame is those people you wish to make conclusions about, The sampling frame is the subset of people from which you collect your data.
- 5) What is coverage-error? If your sampling frame does not represent your target frame, coverage error will occur.
- 6) What is the difference between coverage error and sampling error? In coverage error, your sampling frame does not represent your target frame. Sampling error is a deliberate choice it means that there is selection in the sampling frame. The samples do not consist of the entire sampling frame, therefore under or overrepresentation may occur.
